

The Algorithmic Stadium: AI Agents, Fan Emotion, and the Future of Global Sport

Online CrewAI + LaTeX Research Book

Authors: Aisha Abu Dahesh and Yousef Asadi

Course: Orchestration of AI Agents

Assignment 03

Lecturer: Dr. Yoram Reuven Segal

University of Haifa

June 2026

Abstract

This research booklet gives a broad conceptual frame, evaluation model, and production workflow for the selected topic while demonstrating a controlled CrewAI and LaTeX publication pipeline.

Keywords: sport, World Cup 2026, AI agents, CrewAI, LaTeX, BiDi, evaluation.

0.28 Fan Experience Through Data Governance and Media Pressure	12
0.29 Competitive Fairness Through Stadium Safety and Travel Equity	12

0.30 Tournament Emotion Through Match Day and Youth Pathways 13

0.31 Player Welfare Through Broadcast Narrative and Safety Planning 13

0.32 Fan Experience Through Training Load and Shared Drama 13

0.33 Competitive Fairness Through Supporter Culture and Public Trust 14

0.1. Introduction: The Stadium as a Data Arena

The Algorithmic Stadium: AI Agents, Fan Emotion, and the Future of Global Sport studies the stadium as a social and computational system. AI agents now shape ticketing, scouting, broadcast highlights, tactical analysis, fan sentiment, safety operations, and live storytelling. Sport becomes a field where emotion and analytics meet.

0.2. Fan Emotion and Algorithmic Mediation

The key issue is not only whether AI predicts performance. It is whether AI changes how fans feel suspense, loyalty, disappointment, and belonging. Personalized feeds can deepen attachment, but they can also fragment the shared public experience of watching a match together.

Figure 1: Agent system inside the algorithmic stadium

0.3. Stadium Evaluation Table

Layer	Signals	AI Use
Performance	tracking, fatigue, tactics	coaching insight
Fan emotion	chants, posts, attention, movement	experience design
Operations	queues, safety, transport, pricing	stadium management

Table 1: AI layers in global sport

0.4. Engagement Model

$$F = 0.30P + 0.25E + 0.25S + 0.20T$$

Here P is performance quality, E emotional resonance, S shared identity, and T technological support.

0.5. Bilingual BiDi Demonstration

עמוד זה מדגים פסקה עברית חיה בתוך מסמך שמוגדר בעיקר באנגלית. הטקסט מיושר לימין, נשבר לשורות בצורה טבעית, ונשמר כטקסט אמיתי שאפשר לבחור, להעתיק ולבדוק. כדי למנוע ערבוב כיווניות, הפסקה משתמשת בעברית רציפה ואינה משלבת מונחים לועזיים באמצע המשפט.

0.6. Live Match Data

The algorithmic stadium collects tracking, fatigue, crowd movement, ticket scans, and broadcast attention.

Each signal belongs to performance, safety, business, or fan-experience layers.

Mixing layers can turn emotion into pure pricing data.

The system separates analytical goals before making recommendations.

0.7. Fan Emotion

Fans experience sport through hope, rivalry, memory, suspense and belonging.

Sentiment, chants and viewing behavior are interpreted as cultural signals, not only engagement metrics.

Personalization can fragment the shared match story.

AI should support accessibility while preserving collective moments.

0.8. Coaching Judgment

Agents can detect fatigue, pressing traps, and tactical imbalance.

Model outputs are compared with match context, player confidence and tournament pressure.

Statistics alone can misread human momentum.

The coach receives evidence, not automatic authority.

0.9. Broadcast Storytelling

A highlight is not always the statistically largest event.

Crowd reaction, defensive recovery and symbolic substitutions can matter.

Automated clips may flatten narrative drama.

The system combines event data with story context.

0.10. Player Data Rights

Tracking data affects contracts, selection and public reputation.

Athletes need visibility into conclusions drawn from their bodies.

Opaque analytics can create unfair career consequences.

Governance must include challenge, correction and consent mechanisms.

0.11. Small Federation Access

Wealthy teams can buy stronger analytics than small teams.

Shared tools and standards can reduce unfair data gaps.

Technology may widen competitive inequality.

Leagues should define fair access rules for core analytics.

0.12. Stadium Operations

AI can reduce queues, improve transport and support safety planning.

Operational data must be judged by fan welfare, not only revenue.

Optimization can become extraction if every delay becomes a sales opportunity.

The system reports service quality alongside commercial outcomes.

0.13. Authenticity

Sport depends on uncertainty and shared drama.

Prediction should explain possibilities without pretending the match is solved.

Overconfident analytics can drain suspense.

AI should enrich interpretation while leaving room for surprise.

0.14. Tournament Emotion Through Match Day and Shared Drama

Tournament Emotion becomes concrete when read through Match Day, Shared Drama, and stadium evacuation, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is rivalry, pressure, memory, and national identity; through Match Day, Shared Drama, and stadium evacuation, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is reducing a match to prediction charts, so the argument about Match Day inside Shared Drama and stadium evacuation must remain tied to consequences inside the topic.

The practical response is to read analytics through the emotional stakes of the game. This keeps the recommendation useful for Shared Drama and stadium evacuation instead of drifting into process commentary.

0.15. Player Welfare Through Broadcast Narrative and Public Trust

Player Welfare becomes concrete when read through Broadcast Narrative, Public Trust, and travel schedule, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is fatigue, injury risk, and schedule load; through Broadcast Narrative, Public Trust, and travel schedule, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is using tracking data only for performance extraction, so the argument about Broadcast Narrative inside Public Trust and travel schedule must remain tied to consequences inside the topic.

The practical response is to balance competitive insight with athlete protection. This keeps the recommendation useful for Public Trust and travel schedule instead of drifting into process commentary.

0.16. Fan Experience Through Training Load and Player Rights

Fan Experience becomes concrete when read through Training Load, Player Rights, and underdog campaign, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is chants, travel, queues, broadcast access, and shared attention; through Training Load, Player Rights, and underdog campaign, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is turning supporters into pricing signals, so the argument about Training Load inside Player Rights and underdog campaign must remain tied to consequences inside the topic.

The practical response is to measure service quality alongside revenue. This keeps the recommendation useful for Player Rights and underdog campaign instead of drifting into process commentary.

0.17. Competitive Fairness Through Supporter Culture and Crowd Memory

Competitive Fairness becomes concrete when read through Supporter Culture, Crowd Memory, and World Cup qualifier, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is analytics budgets, data access, and federation resources; through Supporter Culture, Crowd Memory, and World Cup qualifier, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is widening gaps between rich and small teams, so the argument about Supporter Culture inside Crowd Memory and World Cup qualifier must remain tied to consequences inside the topic.

The practical response is to define shared standards for core sport data. This keeps the recommendation useful for Crowd Memory and World Cup qualifier instead of drifting into process commentary.

0.18. Tournament Emotion Through Tournament Travel and Competitive Balance

Tournament Emotion becomes concrete when read through Tournament Travel, Competitive Balance, and late penalty, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is rivalry, pressure, memory, and national identity; through Tournament Travel, Competitive Balance, and late penalty, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is reducing a match to prediction charts, so the argument about Tournament Travel inside Competitive Balance and late penalty must remain tied to consequences inside the topic.

The practical response is to read analytics through the emotional stakes of the game. This keeps the recommendation useful for Competitive Balance and late penalty instead of drifting into process commentary.

0.19. Player Welfare Through Youth Development and Media Pressure

Player Welfare becomes concrete when read through Youth Development, Media Pressure, and fan zone queue, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is fatigue, injury risk, and schedule load; through Youth Development, Media Pressure, and fan zone queue, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is using tracking data only for performance extraction, so the argument about Youth Development inside Media Pressure and fan zone queue must remain tied to consequences inside the topic.

The practical response is to balance competitive insight with athlete protection. This keeps the recommendation useful for Media Pressure and fan zone queue instead of drifting into process commentary.

0.20. Fan Experience Through Data Governance and Travel Equity

Fan Experience becomes concrete when read through Data Governance, Travel Equity, and youth academy, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is chants, travel, queues, broadcast access, and shared attention; through Data Governance, Travel Equity, and youth academy, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is turning supporters into pricing signals, so the argument about Data Governance inside Travel Equity and youth academy must remain tied to consequences inside the topic.

The practical response is to measure service quality alongside revenue. This keeps the recommendation useful for Travel Equity and youth academy instead of drifting into process commentary.

0.21. Competitive Fairness Through Stadium Safety and Youth Pathways

Competitive Fairness becomes concrete when read through Stadium Safety, Youth Pathways, and injury return, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is analytics budgets, data access, and federation resources; through Stadium Safety, Youth Pathways, and injury return, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is widening gaps between rich and small teams, so the argument about Stadium Safety inside Youth Pathways and injury return must remain tied to consequences inside the topic.

The practical response is to define shared standards for core sport data. This keeps the recommendation useful for Youth Pathways and injury return instead of drifting into process commentary.

0.22. Tournament Emotion Through Match Day and Safety Planning

Tournament Emotion becomes concrete when read through Match Day, Safety Planning, and broadcast replay, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is rivalry, pressure, memory, and national identity; through Match Day, Safety Planning, and broadcast replay, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is reducing a match to prediction charts, so the argument about Match Day inside Safety Planning and broadcast replay must remain tied to consequences inside the topic.

The practical response is to read analytics through the emotional stakes of the game. This keeps the recommendation useful for Safety Planning and broadcast replay instead of drifting into process commentary.

0.23. Player Welfare Through Broadcast Narrative and Shared Drama

Player Welfare becomes concrete when read through Broadcast Narrative, Shared Drama, and small federation, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is fatigue, injury risk, and schedule load; through Broadcast Narrative, Shared Drama, and small federation, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is using tracking data only for performance extraction, so the argument about Broadcast Narrative inside Shared Drama and small federation must remain tied to consequences inside the topic.

The practical response is to balance competitive insight with athlete protection. This keeps the recommendation useful for Shared Drama and small federation instead of drifting into process commentary.

0.24. Fan Experience Through Training Load and Public Trust

Fan Experience becomes concrete when read through Training Load, Public Trust, and derby atmosphere, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is chants, travel, queues, broadcast access, and shared attention; through Training Load, Public Trust, and derby atmosphere, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is turning supporters into pricing signals, so the argument about Training Load inside Public Trust and derby atmosphere must remain tied to consequences inside the topic.

The practical response is to measure service quality alongside revenue. This keeps the recommendation useful for Public Trust and derby atmosphere instead of drifting into process commentary.

0.25. Competitive Fairness Through Supporter Culture and Player Rights

Competitive Fairness becomes concrete when read through Supporter Culture, Player Rights, and stadium evacuation, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is analytics budgets, data access, and federation resources; through Supporter Culture, Player Rights, and stadium evacuation, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is widening gaps between rich and small teams, so the argument about Supporter Culture inside Player Rights and stadium evacuation must remain tied to consequences inside the topic.

The practical response is to define shared standards for core sport data. This keeps the recommendation useful for Player Rights and stadium evacuation instead of drifting into process commentary.

0.26. Tournament Emotion Through Tournament Travel and Crowd Memory

Tournament Emotion becomes concrete when read through Tournament Travel, Crowd Memory, and travel schedule, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is rivalry, pressure, memory, and national identity; through Tournament Travel, Crowd Memory, and travel schedule, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is reducing a match to prediction charts, so the argument about Tournament Travel inside Crowd Memory and travel schedule must remain tied to consequences inside the topic.

The practical response is to read analytics through the emotional stakes of the game. This keeps the recommendation useful for Crowd Memory and travel schedule instead of drifting into process commentary.

0.27. Player Welfare Through Youth Development and Competitive Balance

Player Welfare becomes concrete when read through Youth Development, Competitive Balance, and underdog campaign, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is fatigue, injury risk, and schedule load; through Youth Development, Competitive Balance, and underdog campaign, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is using tracking data only for performance extraction, so the argument about Youth Development inside Competitive Balance and underdog campaign must remain tied to consequences inside the topic.

The practical response is to balance competitive insight with athlete protection. This keeps the recommendation useful for Competitive Balance and underdog campaign instead of drifting into process commentary.

0.28. Fan Experience Through Data Governance and Media Pressure

Fan Experience becomes concrete when read through Data Governance, Media Pressure, and World Cup qualifier, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is chants, travel, queues, broadcast access, and shared attention; through Data Governance, Media Pressure, and World Cup qualifier, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is turning supporters into pricing signals, so the argument about Data Governance inside Media Pressure and World Cup qualifier must remain tied to consequences inside the topic.

The practical response is to measure service quality alongside revenue. This keeps the recommendation useful for Media Pressure and World Cup qualifier instead of drifting into process commentary.

0.29. Competitive Fairness Through Stadium Safety and Travel Equity

Competitive Fairness becomes concrete when read through Stadium Safety, Travel Equity, and late penalty, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is analytics budgets, data access, and federation resources; through Stadium Safety, Travel Equity, and late penalty, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is widening gaps between rich and small teams, so the argument about Stadium Safety inside Travel Equity and late penalty must remain tied to consequences inside the topic.

The practical response is to define shared standards for core sport data. This keeps the recommendation useful for Travel Equity and late penalty instead of drifting into process commentary.

0.30. Tournament Emotion Through Match Day and Youth Pathways

Tournament Emotion becomes concrete when read through Match Day, Youth Pathways, and fan zone queue, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is rivalry, pressure, memory, and national identity; through Match Day, Youth Pathways, and fan zone queue, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is reducing a match to prediction charts, so the argument about Match Day inside Youth Pathways and fan zone queue must remain tied to consequences inside the topic.

The practical response is to read analytics through the emotional stakes of the game. This keeps the recommendation useful for Youth Pathways and fan zone queue instead of drifting into process commentary.

0.31. Player Welfare Through Broadcast Narrative and Safety Planning

Player Welfare becomes concrete when read through Broadcast Narrative, Safety Planning, and youth academy, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is fatigue, injury risk, and schedule load; through Broadcast Narrative, Safety Planning, and youth academy, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is using tracking data only for performance extraction, so the argument about Broadcast Narrative inside Safety Planning and youth academy must remain tied to consequences inside the topic.

The practical response is to balance competitive insight with athlete protection. This keeps the recommendation useful for Safety Planning and youth academy instead of drifting into process commentary.

0.32. Fan Experience Through Training Load and Shared Drama

Fan Experience becomes concrete when read through Training Load, Shared Drama, and injury return, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is chants, travel, queues, broadcast access, and shared attention; through Training Load, Shared Drama, and injury return, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is turning supporters into pricing signals, so the argument about Training Load inside Shared Drama and injury return must remain tied to consequences inside the topic.

The practical response is to measure service quality alongside revenue. This keeps the recommendation useful for Shared Drama and injury return instead of drifting into process commentary.

0.33. Competitive Fairness Through Supporter Culture and Public Trust

Competitive Fairness becomes concrete when read through Supporter Culture, Public Trust, and broadcast replay, because the discussion moves from broad possibility to a specific domain pressure.

The relevant evidence is analytics budgets, data access, and federation resources; through Supporter Culture, Public Trust, and broadcast replay, it anchors the claim in observable material rather than generic enthusiasm.

The main risk is widening gaps between rich and small teams, so the argument about Supporter Culture inside Public Trust and broadcast replay must remain tied to consequences inside the topic.

The practical response is to define shared standards for core sport data. This keeps the recommendation useful for Public Trust and broadcast replay instead of drifting into process commentary.
